Shasta Snow Wreath (*Neviusia cliftonii*)

Shasta snow-wreath is a recently discovered shrub of the rose family endemic to northern California in the vicinity of Shasta Lake, Shasta County. Shasta snow-wreath is now known to occur in limestone outcrops and adjacent slopes along drainages or small canyons; and in mixed woodland, ponderosa pine, and montane hardwood-conifer habitats with metasedimentary/metavolcanic geologic substrates along small drainages and stream corridors (Lindstrand and Nelson 2006). Elevations range between 1,070 and 1,800 feet.

Shasta snow-wreath has been recorded in 17 locations on the Pit River Arm, McCloud River Arm, and the main body of Shasta Lake. Up to 9 of these 17 known sites may be directly affected by the project.

Slender False Lupine (*Thermopsis macrophylla* var. *venosa*)

Slender false lupine is a rhizomatous herb in the family Fabaceae. It occurs at elevations from 328 to 4,495 feet in chaparral, cismontane woodland, lower montane coniferous forest, meadows, seeps, and north coast coniferous forests. Blooming occurs from March through July. This species is known to occur in Del Norte, Humboldt, Shasta, Siskiyou, and Trinity counties in California (California Native Plant Society 2007).

Many slender false-lupine occurrences were found throughout the ESL during the botanical surveys, and individuals at many of these sites would be directly impacted by the proposed project. However, this species has been found to be relatively common throughout the Shasta Lake and vicinity portion of the primary study area and general vicinity.

Cantelow's Lewisia (*Lewisia cantelovii*)

Cantelow's lewisia is a perennial herb found in moist rock outcrops in broad-leaved and conifer forests. It blooms from May through October, and occurs at elevations of 1,080 to 4,500 feet (California Native Plant Society 2007). This species is known to occur in Butte, Nevada, Plumas, Shasta, and Sierra counties.

The Cantelow's lewisia discovery within the Shasta Lake and vicinity portion of the primary study area consists of one occurrence found on a rock outcrop on the right bank of the Upper Sacramento River riverine reach near the Shasta Lake/Upper Sacramento River transition zone. Most likely, at least a portion of the individuals at this location would be directly affected by the project.
