

**Chapter 18****1 Public Health****2 18.1 Introduction**

3 This chapter describes public health hazards in the Study Area related to changes  
4 in the environment that could occur as a result of implementing the alternatives  
5 evaluated in this Environmental Impact Statement (EIS). Implementation of the  
6 alternatives considered in this EIS could affect public health through changes in  
7 available water supplies from the Central Valley Project (CVP) and State Water  
8 Project (SWP); changes in irrigated crop acreage related to potential changes in  
9 operation of the CVP and SWP; changes in wetlands acreage related to potential  
10 changes in ecosystem restoration; and changes in water quality related to potential  
11 changes in operation of the CVP and SWP.

12 Changes in available water supplies, agricultural resources, wetlands, and water  
13 quality are described in more detail in Chapter 5, Surface Water Resources and  
14 Water Supplies; Chapter 12, Agricultural Resources; and Chapter 6, Water  
15 Quality, respectively.

**16 18.2 Regulatory Environment and Compliance**  
**17 Requirements**

18 Potential actions that could be implemented under the alternatives evaluated in  
19 this EIS could affect public health throughout the Study Area. Some of the  
20 actions considered in the alternatives evaluated in this EIS could include facilities  
21 located on public agency lands; or actions implemented, funded, or approved by  
22 Federal and state agencies. These actions would need to be compliant with  
23 appropriate Federal and state agency policies and regulations, as summarized in  
24 Chapter 4, Approach to Environmental Analyses.

**25 18.3 Affected Environment**

26 This section describes the following public health factors that could be potentially  
27 affected by the implementation of the alternatives considered in this EIS.

- 28 • Changes in available water supplies.
- 29 • Increases in the potential for mosquito-borne diseases due to an increase in  
30 wetlands.
- 31 • Changes in the potential for Valley Fever from disturbed soils when irrigation  
32 water supplies change.
- 33 • Changes in the potential for bioaccumulation of mercury in fish and shellfish.

1 Changes in the potential of direct or indirect exposure to high water quality  
2 concentrations of various constituents also may occur due to implementation of  
3 the alternatives. These direct changes to water quality and the related changes to  
4 drinking water safety and consumption of fish or shellfish exposed to high  
5 concentrations of constituents of concern are described in Chapter 6, Water  
6 Quality.

7 Public health effects that could occur due to construction activities are not  
8 discussed in this chapter, including increased exposure to naturally occurring  
9 asbestos, methane production from disturbance of peat soils, disturbance of oil  
10 and gas production fields, use and transport of hazardous wastes, and changes in  
11 wastewater or stormwater discharges. Although several of the alternatives  
12 include assumptions of constructed facilities, those actions will require  
13 subsequent planning and environmental documentation prior to implementation.  
14 The subsequent environmental documentation and related permits will evaluate  
15 public health effects associated with construction and implementation of those  
16 facilities.

### 17 **18.3.1 Public Health Issues Related to Available Water Supplies**

18 Water supply availability can affect public health in several ways. Potential direct  
19 effects to public health are related to reduction of municipal water supplies.  
20 Potential indirect effects to public health are related to reduction of industrial and  
21 irrigation water supplies which could affect the ability to earn an income to fund  
22 food, shelter, and other critical factors necessary for public health. Effects related  
23 to loss of jobs.

24 Availability of water supplies substantially decreased for CVP and SWP water  
25 users during recent droughts in 1976-1977, 1987-1992, and 2012-2014. In  
26 addition, as described in Chapter 5, Surface Water Resources and Water Supplies,  
27 the frequency of substantially reduced water supplies provided by the CVP and  
28 SWP have increased since the 1976-1977 drought due to changes in regulations  
29 and increased water demands by users with higher priorities for water use.

30 During the 2014 drought, CVP and SWP water supply allocations have been  
31 reduced substantially to protect future water supplies and the ability to meet  
32 existing regulations, as described in Chapter 5, Surface Water Resources and  
33 Water Supplies. The allocations were modified throughout the 2013-2014 winter  
34 with the allocations that are the most stringent in the history of the CVP and/or  
35 SWP operations, as summarized below (Reclamation 2014a, 2014b; DWR 2013,  
36 2014).

- 37 • CVP North of Delta Water Users.
  - 38 – Sacramento River Settlement Contractors – allocated 40 percent of total
  - 39 contracted water supply.
  - 40 – Sacramento Valley Refuges that use CVP water supplies – allocated
  - 41 40 percent of total contracted water supply.

- 1       – Agricultural Water Service Contractors – allocated 0 percent of total
- 2       contracted water supply.
- 3       – Municipal and Industrial Water Service Contractors – allocated 50 percent
- 4       of historic water use.
- 5       • CVP In-Delta Water Service Contractor: Contra Costa Water District –
- 6       allocated 50 percent of historic water use.
- 7       • CVP South of Delta Water Users.
- 8       – San Joaquin River Exchange and Settlement Contractors – allocated
- 9       65 percent of total contracted water supply.
- 10      – San Joaquin Valley Refuges that use CVP water supplies – allocated
- 11      65 percent of total contracted water supply.
- 12      – Agricultural Water Service Contractors – allocated 0 percent of total
- 13      contracted water supply.
- 14      – Municipal and Industrial Water Service Contractors – allocated 50 percent
- 15      of historic water use.
- 16      • CVP Friant Division Contractors – allocated 0 percent of total contracted
- 17      water supply.
- 18      • CVP Eastside Water Service Contractors: Water supplies delivered from New
- 19      Melones Reservoir – allocated 55 percent of total contracted water supply.
- 20      • SWP Water Service Contractors – 5 percent of total contracted water supply.

21 Another potential indirect effect to public health is related to reduction of stored  
 22 water in the CVP and SWP reservoirs which could affect the ability to provide  
 23 enough water for firefighting,

24 **18.3.1.1 Public Health and Safety Related to Available Municipal and**  
 25 **Industrial Water Supplies**

26 The Department of the Interior, Bureau of Reclamation (Reclamation) current  
 27 *Draft Municipal and Industrial Shortage Policy* (Reclamation 2005) describes  
 28 that the CVP water service contractors should develop public health and safety  
 29 volumes based California’s public health and safety criteria or criteria developed  
 30 in coordination with Reclamation. Currently, California does not have a uniform  
 31 set of public health and safety criteria for municipal and industrial water supplies.  
 32 At this time, most of the urban communities have not adopted specific public  
 33 health and safety criteria. However, in some of the recently completed Urban  
 34 Water Management Plans, criteria have been identified to protect public health  
 35 and safety that range from 25 to 50 percent of the total water demand, as  
 36 described in Chapter 5, Surface Water Resources and Water Supplies (CCWD  
 37 2011; Folsom 2011; Metropolitan 2010). The Urban Water Management Plans  
 38 indicate that during the critical periods with reductions in water supplies,  
 39 municipal and industrial water uses will be focused on inside water uses with little  
 40 or no outside irrigation water.

1 At this time, no specific volumes have been identified for public health and safety  
2 quantities for the CVP and/or SWP water users. During the 2014 drought, the  
3 Department of Water Resources (DWR) and Reclamation identified 1,500 cubic  
4 feet per second as a minimum amount of CVP and SWP Delta exports for public  
5 health and safety uses for municipal and industrial water supplies. This amount is  
6 also defined by the limitations of the CVP and SWP conveyance facilities, as  
7 described in Chapter 5, Surface Water Resources and Water Supplies.

8 As described above, in 2014, CVP and SWP water supply allocations are at  
9 historically low values. However, it is difficult to identify local public health and  
10 safety issues, non-agricultural related industrial job losses, and economic losses  
11 associated with reductions in CVP and/or SWP water supplies. The potential  
12 economic losses, socioeconomic effects, and environmental justice effects are  
13 described in Chapter 19, Socioeconomics, and Chapter 21, Environmental Justice.

14 **18.3.1.2 Public Health and Safety Related to Available Agricultural Water**  
15 **Supplies**

16 Agricultural water suppliers have developed responses to the reductions in  
17 agricultural water supplies from the CVP and SWP, as described in Chapter 12,  
18 Agricultural Resources. Historically, the number of employment opportunities  
19 that rely directly or indirectly on the availability of CVP and/or SWP water  
20 supplies for irrigation have declined in the areas where the water supplies have  
21 declined, communities within the Central Valley Region and Southern California  
22 Region, as described in Chapter 19, Socioeconomics.

23 **18.3.1.3 Public Health and Safety Related to Water Supply Availability for**  
24 **Wildland Firefighting**

25 Complex terrain, Mediterranean climate, productive natural plant communities,  
26 and ample natural and aboriginal ignition sources has caused California to be a  
27 complex wildfire-prone and fire-adapted landscape. While natural wildfires  
28 support ecosystem health and is critical to maintaining the structure and function  
29 of ecosystems, wildfires pose a significant threat to life, public health,  
30 infrastructure, properties, and natural resources.

31 In accordance with Public Resources Code sections 4201 to 4204 and  
32 Government Code sections 51175 to 51189, the California Department of  
33 Forestry and Fire Prevention (CAL FIRE) has mapped areas of significant fire  
34 hazards based on fuels, terrain, weather, and other relevant factors. The zones are  
35 referred to as Fire Hazard Severity Zones and represent the risks associated with  
36 wildland fires. Under CAL FIRE regulations, areas within very high fire-hazard  
37 risk zones must comply with specific building and vegetation requirements  
38 intended to reduce property damage and loss of life within these areas.

39 According to CAL FIRE, there is an increasing trend of acres burned statewide,  
40 with particular increase in conifer vegetation types (CAL FIRE FRAP 2010).  
41 Statewide, there are 21.3 million acres of land designated as high priority  
42 landscape. The high priority landscape areas include locations with high value  
43 water supplies and high threats of fire and large communities which should be  
44 protected to prevent wildfire threats to maintain ecosystem health, water supplies,

1 and large communities. These areas include the upper Trinity River watershed in  
2 the Trinity River Region; the upper Shasta Lake, Lake Oroville, Folsom Lake,  
3 New Melones Reservoir, and Millerton Lake watersheds in the Central Valley  
4 Region; and communities in throughout the Southern California Region. Areas  
5 designated as high priority landscape occur within 46 of 58 counties. Many rural  
6 counties have significant numbers of communities and acreage in medium priority  
7 landscape, including 508 communities with some high priority landscape areas.

8 CAL FIRE manages the State Responsibility Areas, and local fire districts  
9 manage Local Responsibility Areas. First responders are typically the local fire  
10 districts. The U.S. Forest Service provides wildland fire protection both  
11 independently and cooperatively with the California Department of Forestry and  
12 Fire Protection. In addition, the U.S. Department of the Interior National Park  
13 Service and Bureau of Land Management provide resource management and fire  
14 protection on portions of Federal lands.

15 Firefighting actions frequently involve use of water from reservoirs located close  
16 to wildland fires in the Trinity River, Central Valley, Central Coast, and Southern  
17 California regions, including reservoirs owned by Reclamation and DWR.

### 18 **18.3.2 Public Health Issues Related to Mosquito-Borne Diseases**

19 There are more than 50 species of mosquitos in California, including members of  
20 the four major genera: 24 species of *Aedes*, 5 species of *Anopheles*, 11 species of  
21 *Culex*, and 4 species of *Culiseta* (CDPH et al. 2012). Not all of these species are  
22 known to transmit mosquito-borne viruses, as described below. There are  
23 approximately 15 mosquito-borne viruses that occur in California; however, the  
24 most significant viruses that cause human disease are St. Louis encephalitis virus  
25 (SLEV), western equine encephalomyelitis (WEEV), and West Nile virus (WNV)  
26 (CDPH et al. 2014). No cases of SLEV or WEEV have been reported in humans  
27 over the past few years in California. Malaria also is a mosquito-borne disease  
28 that is caused by a parasite instead of a virus.

29 The *Culex tarsalis* has been identified as part of transmission of SLEV, WEEV,  
30 and WNV, especially in rural areas. The *Culex pipiens* and *Culex*  
31 *quinquefasciatus* have been identified as part of the transmission of WNV and  
32 SLEV. The *Culex stigmatosoma* has been identified as part of the transmission of  
33 WNV and SLEV, especially among birds. The *Aedes melanimon*, *Aedes vexans*,  
34 and *Culex erythrorhax* have been identified as species involved in transmitting  
35 the virus between birds and mammals or between mammals.

36 Mosquitoes, especially *Culex tarsalis*, live in every area of California, and can be  
37 a threat to the health of humans and domestic animals throughout the state. The  
38 mosquito life cycle requires water for the egg, larva, and pupa stages. Some of  
39 the species are more associated with irrigated agriculture, and others are more  
40 associated with urban communities (CDPH et al. 2014). Most of the diseases are  
41 not treatable and vaccines are not available for humans. Methods to prevent  
42 mosquitoes from becoming adults and methods to prevent mosquitos from biting  
43 humans are the only available and practical methods to protect public health.

1 California Health and Safety Code (Sections 2001 – 4(d); 2002; and 2060(b))  
2 describes that landowners are legally responsible to eliminate public nuisances  
3 from their properties, including mosquito breeding habitat (CDPH 2008; CDPH  
4 et al. 2012). Federal, state, and local agencies supplement the preventive  
5 activities of individual landowners toward protecting humans and domestic  
6 animals from mosquito-borne diseases. The California Department of Public  
7 Health (CDPH) monitors mosquito populations throughout the state. In 1915, the  
8 state legislature enacted the Mosquito Abatement Act to allow local mosquito  
9 abatement special districts. The local mosquito and vector control districts  
10 monitor mosquito populations and take actions such as eliminating breeding sites,  
11 using biological control (predators such as mosquitofish), and using chemical  
12 control, to reduce mosquito population size (CDPH 2013a).

### 13 **18.3.2.1 St. Louis Encephalitis Virus**

14 The SLEV is a mosquito-borne virus that circulates among birds and is  
15 transmitted to humans via mosquito bites (CALSURV 2013a; CDPH 2007).  
16 Human infection with SLE can cause mild to severe fever and headaches due to  
17 inflammation of the brain. In severe cases, the illness can cause disorientation  
18 and comas and possibly cause death. Elderly can become more severely ill than  
19 young children with SLEV as compared to WEEV.

20 Since the SLEV was first recognized in 1933 in St. Louis, Missouri, outbreaks  
21 have been reported throughout the United States, Canada, and northern Mexico,  
22 generally between August and October (CALSURV 2013a). In 1984 and 1989,  
23 29 human cases were reported in the San Joaquin Valley of the Central Valley  
24 Region. During the same time periods, 26 human cases were reported in the Los  
25 Angeles area of the Southern California Region. The last human case reported in  
26 California occurred in 1997 in Los Angeles County.

### 27 **18.3.2.2 Western Equine Encephalitis**

28 The WEEV is another mosquito-borne virus that circulates among birds and is  
29 transmitted to horses and humans by mosquitoes (CDPH 2007). Symptoms are  
30 similar to SLEV. Infants and small children are most severely afflicted with  
31 WEEV as compared to SLEV. There is a vaccine for horses, but not for humans.  
32 Historically, substantial number of horses died due to this disease as well as  
33 humans. Recently, there has not been a recorded case of WEEV in humans in  
34 California (CDPH et al. 2014).

### 35 **18.3.2.3 West Nile Virus**

36 West Nile virus (WNV) can cause mild to severe illness in human, other  
37 mammals, and birds.

38 The virus circulates among birds and is transmitted to humans primarily by *Culex*  
39 mosquitoes (CDPH et al. 2014). The WNV was first detected in North America  
40 in New York in 1999, and has subsequently spread to 48 states, Canada, and  
41 Mexico.

1 The WNV first appeared in humans in California in 2002 with the identification  
2 of one human case (CALSURV 2013b). In 2003, three human cases and one  
3 equine case were reported with numerous verified findings of WNV activity  
4 among dead birds and mosquitoes. In 2004, the WNV was reported in  
5 58 counties, with 779 human cases, including 29 WNV-associated deaths  
6 (CALSURV 2013b). From 2003 through 2013, there were 4,004 reported human  
7 cases of WNV with 145 deaths; 16,299 reported bird deaths; and 1,202 reported  
8 cases involving horses (CDPH 2014a). In 2007, 2008, and between 2010 and  
9 2013, the majority of reported human cases occurred in the six counties in  
10 Southern California Region, with most of the cases reported in Los Angeles  
11 County. Between 2007 and 2013, numerous human cases were reported in Butte,  
12 Sutter, Sacramento, Stanislaus, Fresno, Tulare, and Kern counties in the Central  
13 Valley Region. During this same period, no human cases were reported in the  
14 Trinity River Region; Lassen, Plumas, and Nevada counties in the Central Valley  
15 Region; San Benito County in the San Francisco Bay Area Region; and San Luis  
16 Obispo County in the Central Coast Region.

17 In humans, WNV may not result in any symptoms or only mild viral symptoms,  
18 including mild fever, headache, body aches, skin rash, and swollen lymph glands.  
19 Symptoms in less than 1 percent of people that are infected can include headache,  
20 high fever, neck stiffness, stupor, disorientation, coma, tremors, convulsions,  
21 muscle weakness, and paralysis that are associated with meningitis or  
22 encephalitis.

#### 23 **18.3.2.4 Malaria**

24 Malaria also is a mosquito-borne disease caused by a parasite that destroys the red  
25 blood cells of its host. People with malaria often experience fever, chills, and flu-  
26 like illness which can lead to death (CDPH et al. 2012). Malaria is no longer  
27 endemic in California, as well as the rest of the United States, due to intense  
28 mosquito control efforts and anti-malarial drugs. However, the disease is  
29 diagnosed every year, especially in people who have traveled outside the United  
30 States. In 2012, 92 human cases were reported in California (CDPH 2013). Of  
31 the 92 cases, 90 patients had traveled to countries characterized as endemic with  
32 malaria during the previous three years. The *Anopheles* mosquitoes can transmit  
33 the parasite to humans and are prevalent in California (CDPH et al. 2012).

#### 34 **18.3.3 Public Health Issues Related to Valley Fever**

35 Valley fever is an illness that is caused by inhaling the spores of a fungus  
36 *Coccidioides immitis* (CDPH 2013c). This fungus lives in the top layers of some  
37 soils within 2 to 12 inches from the ground surface. When the soil is disturbed by  
38 digging, vehicles, cultivation, or wind, the fungal spores can be inhaled by  
39 persons within the area. Irrigated soils are less likely to contain the fungus than  
40 dry, previously undisturbed soils.

41 In most cases, symptoms in humans include mild cough and flu-like symptoms  
42 (CDPH 2013c). However, in about 40 percent of the reported cases, the illness  
43 can last for more than a month, make the person susceptible to pneumonia, and  
44 include cough, fever, chest pain, headache, muscle ache, rash, joint pain, and/or

1 fatigue. In about 5 percent of the reported cases, the disease becomes  
2 “disseminated Valley Fever” and can cause meningitis and/or affect bones, joints,  
3 skin, or other organs. There are no vaccines to prevent Valley Fever.

4 The *Coccidioides immitis* is endemic in many areas of the southwestern United  
5 States, Mexico, Central America, and South America. In California, the fungus is  
6 found in many areas of the San Joaquin Valley and Southern California  
7 (CDPH 2011, 2014b). In California between 2001 and 2012, there were over  
8 35,000 reported cases of Valley Fever. The number of incidences increased from  
9 1,483 cases in 2001 to 4,094 cases in 2012. The highest number of cases reported  
10 during this period occurred in Kings, Kern, Fresno, Tulare, and Madera counties  
11 in the San Joaquin Valley within the Central Valley Region; San Luis Obispo  
12 County in the Central Coast Region; and Los Angeles County in the Southern  
13 California Region.

14 In general, the people who have the highest risk of exposure to the fungus include  
15 construction workers, archeologists, geologists, wildland fighters, military  
16 personnel, mining or gas/oil extraction workers, and agricultural workers in  
17 non-irrigated areas (CDPH 2013c). Other employees also may be at risk. For  
18 example, members of the cast and crew of a television film became ill with Valley  
19 Fever after working on an outdoor set in Ventura County (CDCP 2014).

20 In 2011, Fresno, Kern, Kings, San Joaquin, San Luis Obispo, and Tulare counties  
21 conducted an analysis of information related to Valley Fever incidences (Fresno  
22 County et al. 2011). The observations included:

- 23 • More incidences were reported in the western parts of Kern, Kings, Fresno,  
24 and San Joaquin counties than in other portions of the counties.
- 25 • More incidences were reported in northern San Luis Obispo County and  
26 southern Tulare County than other portions of the counties.
- 27 • In recent years, there was increased reporting of Valley Fever in the prison  
28 populations in Fresno and Kings counties. In Kern County, 8 percent of the  
29 reported cases between 2005 and 2008 were prison inmates. In Fresno  
30 County, incidences at Pleasant Valley State Prison were 43 percent of the total  
31 cases in the county between 2004 and 2010. In Kings County, incidences at  
32 state prisons were 58 percent of the total cases in the county between 2007  
33 and 2010.

34 In 2012, the San Joaquin Valley Air Pollution Control District (SJVAPCD)  
35 evaluated causes for Valley Fever and options to reduce social and economic  
36 effects of Valley Fever in the San Joaquin Valley (SJVAPCD 2012). The analysis  
37 described that Valley Fever appears to be related to a fungus that forms in subsoil  
38 strata that are dry through a portion of the year. The analysis referred to other  
39 studies that correlated weather patterns with outbreaks of Valley Fever during dry  
40 periods following periods of heavy rainfall. The study also indicated that airborne  
41 *Coccidioides* spores do not generally come from irrigated agriculture. It appears  
42 that it is more likely that the spores are from non-irrigated lands, including  
43 undisturbed natural lands, undeveloped land, and grazing areas. The study

1 indicated that additional monitoring or reduction of particulate matter of  
2 10 microns, or PM<sub>10</sub>, did not appear to be useful in reduction of the potential for  
3 Valley Fever. The study recommended additional funding to develop a vaccine  
4 for Valley Fever.

5 **18.3.4 Public Health Issues Related to High Concentrations of**  
6 **Mercury in Fish and Shellfish**

7 As described in Chapter 6, Water Quality, high concentrations of certain  
8 substances accumulate in fish and shellfish based upon the water quality. The  
9 California Environmental Protection Agency, Office of Environmental Health  
10 Hazard Assessment (OEHHA) evaluates concentrations of potentially toxic  
11 substances in edible tissues of fish and shellfish harvested in water bodies in  
12 California (OEHHA 2014a). Based upon the evaluation, general and specific safe  
13 eating guidelines are developed for the fish and shellfish, as summarized in  
14 Table 18.1. For the water bodies in the Study Area, the primary constituents that  
15 have triggered the development of safe eating guidelines are mercury, dieldrin,  
16 and/or polychlorinated biphenyl (PCB). Other constituents are present, including  
17 selenium; however, the concentrations do not exceed thresholds that would trigger  
18 safe eating guidelines. The OEHHA develops two separate guidelines:  
19 (1) Guidelines for Children from 1 to 17 years and Women from 18 to 45 years;  
20 and (2) Guidelines for Women over 45 years old and Men over 17 years old. The  
21 guidelines recommend the number of servings per week by fish or shellfish  
22 harvested from specific waters. A “serving size” is defined as “about the size and  
23 thickness of your hand” (OEHHA 2014a).

1  
2**Table 18.1 Summary of Safe Eating Guidelines for Fish and Shellfish from Water Bodies in the Study Area Based on Mercury and PCB (servings per week)**

Region	Water Body	Fish and Shellfish <sup>a</sup>	Guidelines for Children and Women up to 45 Years Old <sup>b</sup>	Guidelines for Men and Women over 45 Years Old <sup>b</sup>
Trinity River	Trinity Lake	Rainbow Trout, Brown Trout, White Catfish	2	5
		Largemouth Bass, Smallmouth Bass	Do not eat	1
	Lewiston Lake	Trout	5	7
Central Valley	Sacramento River and Northern Delta	American Shad, Chinook Salmon, Rainbow Trout, Steelhead Trout	2 to 3	7
		Clams	7	7
		Bluegill, other sunfish, carp or goldfish, catfish, crappie, Crayfish, Hardhead, Hitch, sucker	1	3
		Bass, Pikeminnow, White Sturgeon	Do not eat	1
		Striped Bass	Do not eat	2
	Lake Oroville	Bluegill and Green Sunfish	2	5
		Carp, Coho salmon	1	2
		Largemouth Bass, Smallmouth Bass, Redeye, or Spotted Bass; Channel Catfish; White Catfish	Do not eat	1
	Lower Feather River	American Shad, Chinook Salmon, Steelhead Trout	2 to 3	7
		Carp, sucker	1	2
		Redear, other sunfish	1	3
		Black Bass, catfish, Pikeminnow, Striped Bass, White Sturgeon	Do not eat	1
	Englebright Lake	Rainbow Trout	2	7
		Bluegill, other sunfish	1	2
		Largemouth Bass, Smallmouth Bass, Spotted Bass	Do not eat	1
	Rollins Reservoir	Catfish	1	2
Camp Far West Reservoir	Bluegill, other sunfish	1	3	

Region	Water Body	Fish and Shellfish <sup>a</sup>	Guidelines for Children and Women up to 45 Years Old <sup>b</sup>	Guidelines for Men and Women over 45 Years Old <sup>b</sup>
		Largemouth Bass, Smallmouth Bass, Spotted Bass, catfish	Do not eat	1
<b>Central Valley (continued)</b>	Folsom Lake	Bluegill, Green Sunfish, or other sunfish; Rout: 16 inches or less	2	5
		Catfish; Chinook Salmon; Largemouth Bass, Smallmouth Bass, Spotted Bass, trout: over 16 inches	Do not eat	1
	Lake Natoma	Bluegill, Green Sunfish, or other sunfish; trout: 16 inches or less	2	5

2 2014k, 2014l, 2014m, 2014n, 2014o, 2014p, 2014q, 2014r, 2014s, 2014t, 2014u, 2014v,  
3 2014w  
4 Notes:  
5 a. All fish and shellfish names are as appears in the OEHHA guidelines.  
6 b. The OEHHA guidelines refer to the total number of servings of fish per week for one  
7 water body, not just the total for a specific species. For example, OEHHA guidelines for  
8 Men eating fish from Trinity Lake would include no more than 5 servings of Rainbow  
9 Trout, Brown Trout, or White Catfish; OR 1 serving of Largemouth Bass or Smallmouth  
10 Bass.

1 Resident Delta fish accumulate mercury primarily through dietary exposure;  
2 larger, piscivorous (fish-eating) fish show the greatest levels of tissue mercury. In  
3 contrast to anadromous fish (migratory species), the resident fish experience  
4 constant exposure to local mercury sources. Resident species include larger fish  
5 with human health exposure (such as Largemouth Bass) and smaller, forage fish  
6 (such as Inland Silversides). Fish tissues are the ultimate route of exposure to  
7 mercury for humans who consume locally caught fish.

8 Historically, substantial levels of mercury contamination have occurred in fish  
9 throughout the Delta. Mercury concentrations in tissue of the larger piscivorous  
10 fish are lower in for fish in the central Delta as compared to fish from the  
11 Mokelumne, Cosumnes, Sacramento, and San Joaquin rivers (CVRWQCB 2010a,  
12 2010b). Larger, piscivorous resident fish, in general, provide a good record of  
13 fish tissue mercury as a baseline condition for the Delta. Largemouth Bass were  
14 chosen because they are popular sport fish, top predators, live for several years,  
15 and tend to stay in the same area (exhibit high site fidelity). Consequently, they  
16 are excellent indicators of long-term average mercury exposure, risk, and spatial  
17 pattern for ecological and human health. Mercury in sport fish from the Delta  
18 region was reported for Largemouth Bass as a median tissue mercury  
19 concentration of 0.53 mg mercury per kilogram (Hg/kg) wet weight (Davis et al.  
20 2003). Current fish tissue concentrations thus exceed both adopted regulatory  
21 standards and guidance from the U.S. Environmental Protection Agency  
22 (USEPA). In the 2010 Delta TMDL for methylmercury, the Central Valley  
23 Regional Water Quality Control Board (Central Valley RWQCB) established a  
24 fish tissue threshold (fillet concentrations, wet weight mercury) of 0.24 mg Hg/kg  
25 wet weight in trophic level 4 fish (adult, top predatory sport fish, such as  
26 Largemouth Bass) (Central Valley Water Board 2010a). These values are slightly  
27 lower than USEPA's national recommended water quality criterion for fish tissue  
28 of 0.3 mg Hg/kg wet weight for protection of human health and wildlife (USEPA  
29 2001). Therefore, the Delta average for Largemouth Bass fillet concentrations in  
30 the study by Davis et al. exceeds both recommended safe consumption guidelines.

## 31 **18.4 Impact Analysis**

32 This section describes the potential mechanisms for change in conditions and  
33 analytical methods; results of impact analyses; potential mitigation measures; and  
34 cumulative effects.

### 35 **18.4.1 Potential Mechanisms for Change and Analytical Methods**

36 As described in Chapter 4, Approach to Environmental Analysis, the impact  
37 analysis considers changes in public health factors related to changes in CVP and  
38 SWP operations under the alternatives as compared to the No Action Alternative  
39 and Second Basis of Comparison.

40 Changes in CVP and SWP operations under the alternatives as compared to the  
41 No Action Alternative and Second Basis of Comparison could change public  
42 health factors affected by CVP and SWP operations.

1 **18.4.1.1 Changes in Public Health Factors Related to Available CVP and**  
 2 **SWP Agricultural Water Supplies**  
 3 Changes in water supply availability to agricultural water users could result in  
 4 reductions of irrigated acreage and related jobs. The availability of jobs can affect  
 5 public health, as described in Section 18.3.2, Public Health Issues Related to  
 6 Available Water Supplies. As described in Chapter 12, Agricultural Resources,  
 7 agricultural acreage would be similar under Alternatives 1 through 5, No Action  
 8 Alternative, and Second Basis of Comparison. Therefore, the change in public  
 9 health conditions would be the same under all of the alternatives and the Second  
 10 Basis of Comparison; and is not analyzed in this EIS.

11 **18.4.1.2 Changes in Public Health Factors Related to Available Municipal**  
 12 **Water Supplies**  
 13 As described in Section 18.3.2, Public Health Issues Related to Available Water  
 14 Supplies, water supply availability can affect public health related to direct use  
 15 within the household and indirect effects related to adequate water supplies for  
 16 industrial and commercial water users that provide employment. As described in  
 17 Chapter 5, Surface Water Resources and Water Supplies, and Chapter 18,  
 18 Socioeconomics, municipal and industrial water users would rely upon alternate  
 19 water supplies to meet water demands in 2030. Therefore, public health  
 20 conditions related to availability of municipal and industrial water supplies would  
 21 be the same under all of the alternatives and the Second Basis of Comparison; and  
 22 is not analyzed in this EIS.

23 **18.4.1.3 Changes in Public Health Factors Related to Wildland**  
 24 **Firefighting and CVP and SWP Reservoir Storage**  
 25 Stored water in water supply reservoirs is used for wildland firefighting in the  
 26 California foothills and mountains, including water stored in CVP and SWP  
 27 reservoirs. During drier periods, reduced storage levels could affect the  
 28 availability of water for wildlife firefighting, as indicated in changes in CVP and  
 29 SWP reservoir at the end of September in critical dry water years, as described in  
 30 Chapter 5, Surface Water Resources and Water Supplies.  
 31 Reservoirs that store water in the San Francisco Bay Area, Central Coast, and  
 32 Southern California regions are managed to store water supplies as part of short-  
 33 term conveyance management or storage for regional and local water supplies  
 34 using water from numerous sources and water for wildland firefighting is not  
 35 known; and therefore, are not analyzed in this EIS.

36 **18.4.1.4 Changes in Public Health Factors Related to Wetlands**  
 37 **Restoration and Mosquito-Borne Diseases**  
 38 Wetlands provide habitat for mosquito breeding, especially in tidally-influenced  
 39 wetlands with slow moving water and floodplains after the majority of the water  
 40 recedes. Management practices (e.g., designing wetlands to provide flushing  
 41 flows, use of biological controls) can reduce the nuisance and public health  
 42 aspects of mosquito populations. The extent of seasonal floodplains and tidally-  
 43 influenced wetlands in Yolo Bypass, Cache Slough, and Suisun Marsh areas  
 44 would increase in a similar manner under all of the alternatives and the Second

1 Basis of Comparison, as described in Chapter 3, Description of Alternatives.  
2 Therefore, the potential for changes in public health conditions related to  
3 mosquito populations would be the same under all of the alternatives and the  
4 Second Basis of Comparison; and is not analyzed in this EIS.

5 **18.4.1.5 Changes in Public Health Factors Related to Potential**  
6 **Valley Fever**

7 As described above, recent studies have indicated that valley fever exposure  
8 appears to be related to cultivated lands, including lands that are idled due to  
9 agricultural practices or reduced water supply availability. Changes in CVP and  
10 SWP operations under the alternatives and the Second Basis of Comparison  
11 would not affect the extent of non-irrigated lands. Therefore, the potential for  
12 changes in public health conditions related to Valley Fever would be the same  
13 under all of the alternatives and the Second Basis of Comparison; and is not  
14 analyzed in this EIS.

15 **18.4.1.6 Changes in Public Health Factors Related to Mercury in Fish**  
16 **used for Human Consumption**

17 As described above, fish used for human consumption in the Delta have mercury  
18 levels that exceed OEHHA guidelines. Changes in CVP and SWP operations  
19 under the alternatives and the Second Basis of Comparison would change the  
20 accumulated mercury concentrations in fish in the Delta. As described in Chapter  
21 6, Surface Water Quality, the bioavailability and toxicity of mercury is enhanced  
22 through the natural, bacterial conversion of mercury to methylmercury in  
23 marshlands or wetlands. These stagnant locations with reduced oxygen  
24 concentrations promote chemical reduction processes that make methylation  
25 possible. The methylmercury model is based upon the Total Maximum Daily  
26 Load translation equation for mercury developed by the Central Valley Regional  
27 Water Quality Control Board. The model estimates fish tissue concentrations  
28 from waterborne concentrations of mercury in the Delta and evaluates the  
29 potential to cause exceedances of water quality or tissue benchmarks. The tissue  
30 concentrations associated with the Alternatives 1 through 5 were compared to the  
31 No Action Alternative and the Second Basis of Comparison.

32 **18.4.2 Conditions in Year 2030 without Implementation of**  
33 **Alternatives 1 through 5**

34 This EIS includes two bases of comparison, as described in Chapter 3,  
35 Description of Alternatives: the No Action Alternative and the Second Basis of  
36 Comparison. Both of these bases are evaluated at 2030 conditions. Changes that  
37 would occur over the next 15 years without implementation of the alternatives are  
38 not analyzed in this EIS. However, the changes to public health that are assumed  
39 to occur by 2030 under the No Action Alternative and the Second Basis of  
40 Comparison are summarized in this section. Many of the changed conditions  
41 would occur in the same manner under both the No Action Alternative and the  
42 Second Basis of Comparison.

1 **18.4.2.1 Common Changes in Conditions under the No Action Alternative**  
2 **and Second Basis of Comparison**

3 Conditions in 2030 would be different than existing conditions due to:

- 4 • Climate change and sea level rise
- 5 • General plan development throughout California, including increased water  
6 demands in portions of Sacramento Valley
- 7 • Implementation of reasonable and foreseeable water resources management  
8 projects to provide water supplies

9 It is anticipated that climate change would result in more short-duration high-  
10 rainfall events and less snowpack in the winter and early spring months. The  
11 reservoirs would be full more frequently by the end of April or May by 2030 than  
12 in recent historical conditions. However, as the water is released in the spring,  
13 there would be less snowpack to refill the reservoirs. This condition would  
14 reduce reservoir storage and available water supplies to downstream uses in the  
15 summer. The reduced end of September storage also would reduce the ability to  
16 release stored water to downstream regional reservoirs. These conditions would  
17 occur for all reservoirs in the California foothills and mountains, including  
18 non-CVP and SWP reservoirs.

19 These changes would result in a decline of the long-term average CVP and SWP  
20 water supply deliveries by 2030 as compared to recent historical long-term  
21 average deliveries under the No Action Alternative and the Second Basis of  
22 Comparison. However, the CVP and SWP water deliveries would be less under  
23 the No Action Alternative as compared to the Second Basis of Comparison, as  
24 described in Chapter 5, Surface Water Resources and Water Supplies. Due to  
25 climate change and related lower snowfall, end of September low reservoir  
26 storage would be lower in critical dry years by 2030 as compared to recent  
27 historical conditions in Shasta Lake, Lake Oroville, Folsom Lake, New Melones  
28 Reservoir, and San Luis Reservoir. Therefore, the potential for reduced reservoir  
29 water supplies for wildland firefighting would be greater under the No Action  
30 Alternative and Second Basis of Comparison as compared to recent historical  
31 conditions.

32 Under the No Action Alternative and the Second Basis of Comparison, land uses  
33 in 2030 would occur in accordance with adopted general plans.

34 The No Action Alternative and the Second Basis of Comparison assumes  
35 completion of water resources management and environmental restoration  
36 projects that would have occurred without implementation of Alternatives 1  
37 through 5, including regional and local recycling projects, surface water and  
38 groundwater storage projects, conveyance improvement projects, and desalination  
39 projects, as described in Chapter 3, Description of Alternatives. The No Action  
40 Alternative and the Second Basis of Comparison also assumes implementation of  
41 actions included in the 2008 U.S. Fish and Wildlife Service (USFWS) Biological  
42 Opinion (BO) and 2009 National Marine Fisheries Service (NMFS) BO that

1 would have been implemented without the BOs by 2030, as described in  
2 Chapter 3, Description of Alternatives.

3 Under the No Action Alternative and Second Basis of Comparison, it is  
4 anticipated that mercury concentrations in fish tissue within the Delta will be  
5 either similar or greater than recent historical conditions. Phase 1 of the Delta  
6 Mercury Program mandated by the Central Valley RWQCB is currently being  
7 completed to protect people eating one meal per week of larger fish from the  
8 Delta, including Largemouth Bass. Phase 1 is focused on studies and pilot  
9 projects to develop and evaluate management practices to control methylmercury  
10 from mercury sources in the Delta and Yolo Bypass; and to reduce total mercury  
11 loading to the San Francisco Bay. Following completion of Phase 1 in 2019,  
12 Phase 2 will be implemented through 2030. Phase 2 will focus on methylmercury  
13 control programs and reduction programs for total inorganic mercury. Due to the  
14 extent of these studies, it is not anticipated that changes in methylmercury or total  
15 mercury concentrations in fish tissue will be reduced by 2030. Future mercury  
16 reduction and control programs will reduce mercury sources and related fish  
17 tissue concentrations; however, that will occur after 2030.

### 18 **18.4.3 Evaluation of Alternatives**

19 As described in Chapter 4, Approach to Environmental Analysis, Alternatives 1  
20 through 5 have been compared to the No Action Alternative; and the No Action  
21 Alternative and Alternatives 1 through 5 have been compared to the Second Basis  
22 of Comparison.

23 During review of the numerical modeling analyses used in this EIS, an error was  
24 determined in the CalSim II model assumptions related to the Stanislaus River  
25 operations for the Second Basis of Comparison, Alternative 1, and Alternative 4  
26 model runs. Appendix 5C includes a comparison of the CalSim II model run  
27 results presented in this chapter and CalSim II model run results with the error  
28 corrected. Appendix 5C also includes a discussion of changes in the comparison  
29 of groundwater conditions for the following alternative analyses.

- 30 • No Action Alternative compared to the Second Basis of Comparison
- 31 • Alternative 1 compared to the No Action Alternative
- 32 • Alternative 3 compared to the Second Basis of Comparison
- 33 • Alternative 5 compared to the Second Basis of Comparison

#### 34 **18.4.3.1 No Action Alternative**

35 The No Action Alternative is compared to the Second Basis of Comparison.

##### 36 **18.4.3.1.1 Trinity River Region**

37 *Changes in Public Health Factors Related to Wildland Firefighting and CVP and*  
38 *SWP Reservoir Storage*

39 Changes in CVP water supplies and operations under the No Action Alternative  
40 as compared to the Second Basis of Comparison would result in similar end of  
41 September reservoir elevations in critical dry years (changes within 5 percent) at  
42 Trinity Lake, as described in Chapter 5, Surface Water Resources and Water

1 Supplies. Therefore, the potential for water availability for wildland firefighting  
 2 would be similar under the No Action Alternative as compared to the Second  
 3 Basis of Comparison.

4 **18.4.3.1.2 Central Valley Region**

5 *Changes in Public Health Factors Related to Wildland Firefighting and CVP and*  
 6 *SWP Reservoir Storage*

7 Changes in CVP water supplies and operations under the No Action Alternative  
 8 as compared to the Second Basis of Comparison would result in similar end of  
 9 September reservoir elevations in critical dry years (changes within 5 percent) at  
 10 Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir, as  
 11 described in Chapter 5, Surface Water Resources and Water Supplies. Therefore,  
 12 the potential for water availability for wildland firefighting would be similar  
 13 under the No Action Alternative as compared to the Second Basis of Comparison.

14 End of September surface water elevations at San Luis Reservoir in critical dry  
 15 years would be 6 percent lower under the No Action Alternative as compared to  
 16 the Second Basis of Comparison. Therefore, the potential for water availability  
 17 for wildland firefighting would be reduced at San Luis Reservoir under the No  
 18 Action Alternative as compared to the Second Basis of Comparison.

19 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
 20 *Consumption*

21 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
 22 change) in most locations in the Delta, except for Rock Slough, San Joaquin River  
 23 near Antioch, and Montezuma Slough in Suisun Marsh. In these areas, the  
 24 mercury concentrations would increase by 7 percent over long-term conditions  
 25 under the No Action Alternative as compared to the Second Basis of Comparison.  
 26 Under dry and critical dry years, mercury concentrations would increase by 7 to  
 27 8 percent at Rock Slough, intakes of the Banks and Jones pumping plants, and  
 28 Victoria Canal. All values exceed the threshold of 0.24 mg/kg ww for mercury.

29 **18.4.3.2 Alternative 1**

30 Alternative 1 is identical to the Second Basis of Comparison. Alternative 1 is  
 31 compared to the No Action Alternative and the Second Basis of Comparison.  
 32 However, because CVP and SWP operations under Alternative 1 are identical to  
 33 conditions under the Second Basis of Comparison; Alternative 1 is only compared  
 34 to the No Action Alternative.

35 **18.4.3.2.1 Alternative 1 Compared to the No Action Alternative**

36 *Trinity River Region*

37 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 38 *and SWP Reservoir Storage*

39 Changes in CVP water supplies and operations under Alternative 1 as compared  
 40 to the No Action Alternative would result in similar end of September reservoir  
 41 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
 42 Water Resources and Water Supplies. Therefore, the potential for water

1 availability for wildland firefighting would be similar under Alternative 1 as  
2 compared to the No Action Alternative.

3 *Central Valley Region*

4 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
5 *and SWP Reservoir Storage*

6 Changes in CVP water supplies and operations under Alternative 1 as compared  
7 to the No Action Alternative would result in similar end of September reservoir  
8 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, and  
9 New Melones Reservoir, as described in Chapter 5, Surface Water Resources and  
10 Water Supplies. Therefore, the potential for water availability for wildland  
11 firefighting would be similar under Alternative 1 as compared to the No Action  
12 Alternative.

13 End of September surface water elevations at San Luis Reservoir in critical dry  
14 years would be 7 percent higher under Alternative 1 as compared to the No  
15 Action Alternative. Therefore, the potential for water availability for wildland  
16 firefighting would be increased at San Luis Reservoir under Alternative 1 as  
17 compared to the No Action Alternative.

18 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
19 *Consumption*

20 Mercury concentrations in Largemouth Bass would be similar in most locations in  
21 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
22 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
23 would decrease by 6 percent over the long-term conditions under Alternative 1 as  
24 compared to the No Action Alternative. Under dry and critical dry years, mercury  
25 concentrations would decrease by 6 to 8 percent at Rock Slough, intakes of the  
26 Banks and Jones pumping plants, and Victoria Canal. All values exceed the  
27 threshold of 0.24 mg/kg ww for mercury.

28 **18.4.3.2 Alternative 1 Compared to the Second Basis of Comparison**

29 Alternative 1 is identical to the Second Basis of Comparison.

30 **18.4.3.3 Alternative 2**

31 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
32 SWP operations under the No Action Alternative; therefore, Alternative 2 is only  
33 compared to the Second Basis of Comparison.

34 **18.4.3.3.1 Alternative 2 Compared to the Second Basis of Comparison**

35 The CVP and SWP operations under Alternative 2 are identical to the CVP and  
36 SWP operations under the No Action Alternative. Therefore, changes to public  
37 health conditions under Alternatives 2 as compared to the Second Basis of  
38 Comparison would be the same as the impacts described in Section 18.4.3.1,  
39 No Action Alternative.

1 **18.4.3.4 Alternative 3**

2 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
 3 under Alternative 3 are similar to the Second Basis of Comparison with modified  
 4 Old and Middle River flow criteria and New Melones Reservoir operations.

5 As described in Chapter 4, Approach to Environmental Analysis, Alternative 3 is  
 6 compared to the No Action Alternative and the Second Basis of Comparison.

7 **18.4.3.4.1 Alternative 3 Compared to the No Action Alternative**

8 *Trinity River Region*

9 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 10 *and SWP Reservoir Storage*

11 Changes in CVP water supplies and operations under Alternative 3 as compared  
 12 to the No Action Alternative would result in similar end of September reservoir  
 13 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
 14 Water Resources and Water Supplies. Therefore, the potential for water  
 15 availability for wildland firefighting would be similar under Alternative 3 as  
 16 compared to the No Action Alternative.

17 *Central Valley Region*

18 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 19 *and SWP Reservoir Storage*

20 Changes in CVP water supplies and operations under Alternative 3 as compared  
 21 to the No Action Alternative would result in similar end of September reservoir  
 22 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New  
 23 Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface  
 24 Water Resources and Water Supplies. Therefore, the potential for water  
 25 availability for wildland firefighting would be similar under Alternative 3 as  
 26 compared to the No Action Alternative.

27 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
 28 *Consumption*

29 Mercury concentrations in Largemouth Bass would be similar (within 5 percent  
 30 change) in most locations in the Delta, except for San Joaquin River near Antioch  
 31 and Montezuma Slough in Suisun Marsh. In these areas, the mercury  
 32 concentrations would decrease by 6 percent over the long-term conditions under  
 33 Alternative 3 as compared to the No Action Alternative. Mercury concentrations  
 34 under the dry and critical dry years would be similar throughout the Delta. All  
 35 values exceed the threshold of 0.24 mg/kg ww for mercury.

36 **18.4.3.4.2 Alternative 3 Compared to the Second Basis of Comparison**

37 *Trinity River Region*

38 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 39 *and SWP Reservoir Storage*

40 Changes in CVP water supplies and operations under Alternative 3 as compared  
 41 to the Second Basis of Comparison would result in similar end of September  
 42 reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5,

1 Surface Water Resources and Water Supplies. Therefore, the potential for water  
2 availability for wildland firefighting would be similar under Alternative 3 as  
3 compared to the Second Basis of Comparison.

4 *Central Valley Region*

5 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
6 *and SWP Reservoir Storage*

7 Changes in CVP water supplies and operations under Alternative 3 as compared  
8 to the Second Basis of Comparison would result in similar end of September  
9 reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom  
10 Lake, New Melones Reservoir, and San Luis Reservoir, as described in Chapter 5,  
11 Surface Water Resources and Water Supplies. Therefore, the potential for water  
12 availability for wildland firefighting would be similar under Alternative 3 as  
13 compared to the Second Basis of Comparison.

14 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
15 *Consumption*

16 Mercury concentrations in Largemouth Bass would be similar throughout the  
17 Delta under Alternative 3 as compared to the Second Basis of Comparison, as  
18 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
19 of 0.24 mg/kg ww for mercury.

20 **18.4.3.5 Alternative 4**

21 The public health conditions under Alternative 4 would be identical to the  
22 conditions under the Second Basis of Comparison; therefore, Alternative 4 is only  
23 compared to the No Action Alternative.

24 **18.4.3.5.1 Alternative 4 Compared to the No Action Alternative**

25 The CVP and SWP operations under Alternative 4 are identical to the CVP and  
26 SWP operations under the Second Basis of Comparison and Alternative 1.  
27 Therefore, changes in public health conditions under Alternative 4 as compared to  
28 the No Action Alternative would be the same as the impacts described in  
29 Section 12.4.4.2.1, Alternative 1 Compared to the No Action Alternative.

30 **18.4.3.6 Alternative 5**

31 As described in Chapter 3, Description of Alternatives, CVP and SWP operations  
32 under Alternative 5 are similar to the No Action Alternative with modified Old  
33 and Middle River flow criteria and New Melones Reservoir operations. As  
34 described in Chapter 4, Approach to Environmental Analysis, Alternative 5 is  
35 compared to the No Action Alternative and the Second Basis of Comparison.

36 **18.4.3.6.1 Alternative 5 Compared to the No Action Alternative**

37 *Trinity River Region*

38 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
39 *and SWP Reservoir Storage*

40 Changes in CVP water supplies and operations under Alternative 5 as compared  
41 to the No Action Alternative would result in similar end of September reservoir

1 elevations in critical dry years at Trinity Lake, as described in Chapter 5, Surface  
 2 Water Resources and Water Supplies. Therefore, the potential for water  
 3 availability for wildland firefighting would be similar under Alternative 5 as  
 4 compared to the No Action Alternative.

5 *Central Valley Region*

6 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 7 *and SWP Reservoir Storage*

8 Changes in CVP water supplies and operations under Alternative 5 as compared  
 9 to the No Action Alternative would result in similar end of September reservoir  
 10 elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom Lake, New  
 11 Melones Reservoir, and San Luis Reservoir, as described in Chapter 5, Surface  
 12 Water Resources and Water Supplies. Therefore, the potential for water  
 13 availability for wildland firefighting would be similar under Alternative 5 as  
 14 compared to the No Action Alternative.

15 *Changes in Public Health Factors Related to Mercury in Fish used for Human*  
 16 *Consumption*

17 Mercury concentrations in Largemouth Bass would be similar throughout the  
 18 Delta under Alternative 5 as compared to the No Action Alternative, as  
 19 summarized in Chapter 6, Surface Water Quality. All values exceed the threshold  
 20 of 0.24 mg/kg ww for mercury.

21 **18.4.3.6.2 Alternative 5 Compared to the Second Basis of Comparison**

22 *Trinity River Region*

23 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 24 *and SWP Reservoir Storage*

25 Changes in CVP water supplies and operations under Alternative 5 as compared  
 26 to the Second Basis of Comparison would result in similar end of September  
 27 reservoir elevations in critical dry years at Trinity Lake, as described in Chapter 5,  
 28 Surface Water Resources and Water Supplies. Therefore, the potential for water  
 29 availability for wildland firefighting would be similar under Alternative 5 as  
 30 compared to the Second Basis of Comparison.

31 *Central Valley Region*

32 *Changes in Public Health Factors Related to Wildland Firefighting and CVP*  
 33 *and SWP Reservoir Storage*

34 Changes in CVP water supplies and operations under Alternative 5 as compared  
 35 to the Second Basis of Comparison would result in similar end of September  
 36 reservoir elevations in critical dry years at Shasta Lake, Lake Oroville, Folsom  
 37 Lake, and New Melones Reservoir, as described in Chapter 5, Surface Water  
 38 Resources and Water Supplies. Therefore, the potential for water availability for  
 39 wildland firefighting would be similar under Alternative 5 as compared to the  
 40 Second Basis of Comparison.

41 End of September surface water elevations at San Luis Reservoir in critical dry  
 42 years would be 9 percent lower under Alternative 5 as compared to the Second

1 Basis of Comparison. Therefore, the potential for water availability for wildland  
 2 firefighting would be reduced at San Luis Reservoir under Alternative 5 as  
 3 compared to the Second Basis of Comparison.

4 *Changes in Public Health Factors Related to Mercury in Fish used for*  
 5 *Human Consumption*

6 Mercury concentrations in Largemouth Bass would be similar in most locations in  
 7 the Delta, except for Rock Slough, San Joaquin River near Antioch, and  
 8 Montezuma Slough in Suisun Marsh. In these areas, the mercury concentrations  
 9 would increase by 7 to 8 percent over long-term conditions under Alternative 5 as  
 10 compared to the Second Basis of Comparison. During dry and critical dry years,  
 11 mercury concentrations also would increase by 7 percent at intakes to Banks  
 12 Pumping Plant and Jones Pumping Plant; and 13 percent at Rock Slough. All  
 13 values exceed the threshold of 0.24 mg/kg ww for mercury.

14 **18.4.3.7 Summary of Environmental Consequences**

15 The results of the environmental consequences of implementation of  
 16 Alternatives 1 through 5 as compared to the No Action Alternative and the  
 17 Second Basis of Comparison are presented in Tables 18.2 and 18.3, respectively.

18 **Table 18.2 Comparison of Alternatives 1 through 5 to No Action Alternative**

Alternative	Potential Change	Consideration for Mitigation Measures
Alternative 1	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 7 percent increase at San Luis Reservoir. Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	None needed
Alternative 2	No effects on public health issues.	None needed
Alternative 3	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir. Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 6 percent decrease near San Joaquin River at Antioch and Montezuma Slough over the long-term conditions.	None needed
Alternative 4	Same effects as described for Alternative 1 compared to the No Action Alternative.	None needed
Alternative 5	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir. Similar mercury concentrations in Largemouth Bass throughout the Delta.	None needed

1 **Table 18.3 Comparison of No Action Alternative and Alternatives 1 through 5 to**  
 2 **Second Basis of Comparison**

Alternative	Potential Change	Consideration for Mitigation Measures
No Action Alternative	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 6 percent decrease at San Luis Reservoir.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.
Alternative 1	No effects on public health issues.	Not considered for this comparison.
Alternative 2	Same effects as described for No Action Alternative as compared to the Second Basis of Comparison.	Not considered for this comparison.
Alternative 3	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, New Melones Reservoir, and San Luis Reservoir.  Similar mercury concentrations in Largemouth Bass throughout the Delta.	Not considered for this comparison.
Alternative 4	No effects on public health issues.	Not considered for this comparison.
Alternative 5	Similar water supply availability for wildland firefighting at Trinity Lake, Shasta Lake, Lake Oroville, Folsom Lake, and New Melones Reservoir; and a 9 percent decrease at San Luis Reservoir.  Similar mercury concentrations in Largemouth Bass in the most of the Delta; and a 7 percent increase near Rock Slough, San Joaquin River at Antioch, and Montezuma Slough over the long-term conditions.	Not considered for this comparison.

3 **18.4.3.8 Potential Mitigation Measures**

4 Changes in CVP and SWP operations under Alternatives 1 through 5 as compared  
 5 to the No Action Alternative would not result in changes in public health factors.  
 6 Therefore, there would be no adverse impacts to public health factors; and no  
 7 mitigation measures are required.

8 **18.4.3.9 Cumulative Effects Analysis**

9 As described in Chapter 3, the cumulative effects analysis considers projects,  
 10 programs, and policies that are not speculative; and are based upon known or  
 11 reasonably foreseeable long-range plans, regulations, operating agreements, or  
 12 other information that establishes them as reasonably foreseeable.

1 The No Action Alternative, Alternatives 1 through 5, and Second Basis of  
2 Comparison include climate change and sea level rise, implementation of general  
3 plans, and completion of ongoing projects and programs (see Chapter 3,  
4 Description of Alternatives). The effects of these items were analyzed  
5 quantitatively and qualitatively, as described in the Impact Analysis of this  
6 chapter. The discussion below focuses on the qualitative effects of the  
7 alternatives and other past, present, and reasonably foreseeable future projects  
8 identified for consideration of cumulative effects (see Chapter 3, Description of  
9 Alternatives).

#### 10 **18.4.3.9.1 No Action Alternative and Alternatives 1 through 5**

11 Continued coordinated long-term operation of the CVP and SWP under the  
12 No Action Alternative would result in reduced CVP and SWP water supply  
13 availability as compared to recent conditions due to climate change and sea level  
14 rise by 2030. These conditions are included in the analysis presented above.

15 Future water resource management projects considered in cumulative effects  
16 analysis could increase water supply availability, as described in Chapter 5,  
17 Surface Water Resources and Water Supplies. These projects would not  
18 necessarily result in changes in public health factors.

19 There also are several ongoing programs that could result in reductions in CVP  
20 and SWP water supply availability due to changes in flow patterns in the  
21 Sacramento and San Joaquin rivers watersheds and the Delta that could reduce  
22 availability of CVP and SWP water deliveries as well as local and regional water  
23 supplies, as described in Chapter 5, Surface Water Resources and Water Supplies.  
24 These projects would not necessarily result in changes in public health factors.

25 There would be no adverse public health factors impacts associated with  
26 implementation of the alternatives as compared to the No Action Alternative or  
27 the Second Basis of Comparison. Therefore, Alternatives 1 through 5 would not  
28 contribute adverse cumulative impacts to public health factors.
