APPENDIX 6B

Water Resources System Modeling

6B.1 Overview and Description

6B.1.1 Introduction

This appendix provides a description of the overall analytical process used in evaluating Sites Reservoir Project (Project) alternatives for the Sites Reservoir Project Draft Environmental Impact Report/Environmental Impact Statement (Project DEIR/EIS). It provides additional detail to the analytical framework discussion provided in Chapter 5 Guide to the Resource Analyses. In addition, this appendix also describes the CALSIM II model that was used to study the operational changes under the DEIR/EIS Alternatives and results used in the detailed evaluation of alternatives.

6B.1.2 Analytical Framework

Project alternatives were formulated to achieve multiple benefits. Chapter 3 Description of the Sites Reservoir Project Alternatives describes the primary and secondary objectives of the Project. Project alternatives operations are primarily focused on improving water supply reliability, Delta water quality, survival of anadromous fish and flexible hydropower generation. The analytical framework, tools, and analyses were formulated for evaluating the benefits and impacts of Project alternatives for all the primary objectives. The framework provides for iteratively refining operations criteria to minimize both the systemwide and localized impacts on various resources while maximizing the benefits of the Project operations in meeting the multiple primary objectives.

A detailed list of the modeling tools and analyses that are part of the analytical framework is provided in Chapter 5 Guide to the Resource Analyses. Figure 6B-1 shows the key models that are part of the analytical framework. It also shows the data flow among the models. The primary model in the framework is CALSIM II with inputs describing the hydrology, facilities, water management, regulatory standards, and operational criteria assumptions. CALSIM II outputs regarding system operation decisions including deliveries, flows and storages are then used by every other model in the analytical framework. CALSIM II operations were informed based on the reporting metrics from various models that simulate river temperatures, anadromous fish survival and population, Delta water quality, hydropower generation and socioeconomics.

Once refined and finalized, for each DEIR/EIS Alternative, CALSIM II results were used to study the systemwide impacts in various resource areas including surface water, recreation, fluvial geomorphology and riparian habitat, flood control, groundwater, aquatic biology, botanical, terrestrial, socioeconomics, climate change, power, growth inducing etc.

Upper Sacramento River Daily Operations Model (USRDOM) uses the CALSIM II outputs regarding the operational controls and reservoir releases to simulate daily reservoir operations and daily river flows for the upper Sacramento River from Shasta Dam to Knights Landing. For evaluating Project operations under DEIR/EIS Alternatives, CALSIM II and USRDOM were simulated iteratively to determine potential restrictions on the Sites Reservoir diversions due to pulse flow conditions in Sacramento River. USRDOM is described in Appendix 6C Upper Sacramento River Daily River Flow and Operations Modeling. USRDOM results were also used to study the impacts in the Surface Water Resources. In

addition, CALSIM II and/or USRDOM results were used by other models in the framework to generate the reporting metrics to evaluate systemwide impacts for various DEIR/EIS resources.

Figure 6B-1 shows the key reporting metrics for each modeling tool in the analytical framework. Delta Simulation Model (DSM2), described in Appendix 7D Sacramento-San Joaquin Delta Modeling, was used to simulate hydrodynamics (flow, velocity and water levels) and water quality (salinity) in the Sacramento-San Joaquin Delta. The Upper Sacramento River Water Quality Model (USRWQM), described in Appendix 7E River Temperature Modeling, was used to simulate reservoir and river temperatures in the upper Sacramento River, from Shasta Lake to Knights Landing, including the CVP facilities in the Trinity River basin and the tributaries along the Sacramento River. The Bureau of Reclamation (Reclamation) Temperature Model, described in Appendix 7E River Temperature Modeling, was used to simulate reservoir and river temperatures in the Trinity River, Feather River, and Stanislaus River. The Folsom CE-QUAL-W2 model, described in Appendix 7E River Temperature Modeling, was used to simulate reservoir and river temperatures on the American River. Using the flow results from USRDOM and temperature results from USRWQM, SALMOD and IOS models were simulated to study the impacts of DEIR/EIS Alternatives on the anadromous fish in the Sacramento River. Similarly, using the temperature and flow results from the Reclamation Temperature Model, the Reclamation Salmon Mortality Model simulates the impacts of the DEIR/EIS Alternatives on early life stage mortality of salmonids in the Trinity, Sacramento, Feather, and American rivers. SALMOD, IOS and Reclamation Salmon Mortality Models are described in Appendix 12xx. LTGEN, SWP Power, NODOS Power and other power modeling tools, described in Appendix 31A Power Planning Study (PARO) and Appendix 31B CVP-SWP Power Modeling, were used to study the impacts of DEIR/EIS Alternatives on the power production and use. Several economic modeling tools, described in the appendixes for Chapter 22 Socioeconomics, were used to study the impact of the DEIR/EIS Alternatives on the agricultural water supply economics, urban water supply and water quality economics and other regional socioeconomics. Several other analytical tools and models that are not shown in the Figure 6B-1, but described in Chapter 5 Guide to the Resource Analyses and other resource chapters, were used in the detailed systemwide impact analysis of the DEIR/EIS Alternatives.

In addition to the studying the systemwide impacts, the analytical framework was also used to study the local impacts in the primary and secondary study areas. Figure 6B-2 shows the key modeling tools used to study the local watershed impacts under various resource areas. The daily river flows from the USRDOM were used to simulate the impacts to fluvial geomorphology and riparian habitat in the upper Sacramento River, using SRH tools. The SRH tools are described in the appendixes for Chapter 8 Fluvial Geomorphology and Riparian Habitat. As described earlier, USRWQM was used to study river temperatures in the upper Sacramento River. SALMOD, IOS and SAC-EFT were used to study the impacts on the Sacramento River anadromous fish. SAC-EFT, described in Appendix 8B Sacramento River Ecological Flows Tool, was also used to study the riparian habitat, botanical and terrestrial impacts. Daily river and tributary flows from the USRDOM model were also used in studying the worst-case water quality impacts in the Sacramento River, as described in Appendix 7C Surface Water Quality Analysis for Electrical Conductivity at Proposed Intakes. Daily Sites Reservoir diversions and river flows from USRDOM along with the river temperatures at the Sites Reservoir diversion intakes from the USRWQM were used in studying the potential impact of the Sites Reservoir releases on the temperatures in the Sacramento River near the Delevan Pipeline, as described in Appendix 7F Sites Reservoir Discharge Temperature Modeling. Several other resource-specific analyses, described in respective resource chapters, were developed to study the DEIR/EIS Alternatives' impacts in the primary and secondary study areas, using the CALSIM II and USRDOM flow results.

6B.1.2.1 Appropriate Use of Modeling Results

The models developed and applied in planning analysis such as the DEIR/EIS impact evaluation, are generalized and simplified representations of a complex water resources system. Even so, the models used are informative and helpful in understanding the performance and potential effects (both positive and negative) of the operation of a project and its interaction with the water resources system under consideration. A brief description of appropriate use of the model results to compare two scenarios or to compare against threshold values or standards is presented below.

Absolute vs. Relative Use of the Model Results

The models used in planning analysis are not predictive models (in how they are applied in this project), and therefore the results cannot be considered as absolute with and within a quantifiable confidence interval. The model results are only useful in a comparative analysis and can only serve as an indicator of condition (e.g., compliance with a standard) and of trend (e.g., generalized impacts).

Appropriate Reporting Time-Step

Due to the assumptions involved in the input data sets and model logic, care must be taken to select the most appropriate time-step for the reporting of model results. Sub-monthly (e.g., weekly or daily) reporting of model results are generally inappropriate for all models and the results should be presented on a monthly basis. Specific to the DEIR/EIS, there are exceptions to this guidance, and selected model results can be reported on a sub-monthly basis with adequate caution.

Appropriate Reporting Locations

Due to the assumptions involved in the input data sets and model logic, care must be taken to select the most appropriate reference locations (and/or boundaries) for the reporting of model results. Each model assumes a simplified spatial representation of the water resource system and sub-systems. Reporting of model results inconsistent with the spatial representation of the model is inappropriate for all models.

Selection of Model Results

Specific to the DEIR/EIS, substantial improvements to existing and new models have been developed to support the project team needs. For features within the Sacramento River and the Colusa Basin (where the Project would be located), a set of new models have been developed. These models have not been used in previous analyses.

Statistical Comparisons are Preferred

Absolute differences computed at a point in time between model results from an alternative and a baseline, or an alternative and a threshold, to evaluate impacts is an inappropriate use of model results. Reporting seasonal patterns from long-term averages and water year type averages (e.g., D1641 40-30-30 classification) is appropriate. Statistics based on long-term and water year type averages are an appropriate use of model results. Computing differences between long-term or water-year-type averages of model results from two scenarios is appropriate. The most appropriate presentation of monthly and annual model results is in the form of probability distributions and comparisons of probability distributions (e.g., cumulative probabilities). If necessary, comparisons of model results against threshold or standard values should be limited to comparisons based on cumulative probability distributions. Information specific to a model calibration (or lack of) and performance in predictive and comparative evaluations should be considered in making the choice to use these types of comparisons.

Formats for Presentation of Model Results

Acceptable formats considering the preceding recommendations and guidelines were used presenting the modeling results in the DEIR/EIS. Monthly and annual summary data presented in the following formats:

- Long-term average summary and year type based summary tables and graphics showing monthly and/or annual statistics derived from the model results
- Cumulative exceedance probability monthly and/or annual model results shown only by rank/order or only by probability statistic

Comparative statistics based on these two types of presentations are generally acceptable. Presentation of specific values associated with exceedance probabilities should be done in the context of a complete presentation of the range of values across all probability levels. If this is not possible, values associated with extremely high or low probabilities should not be presented (it is reasonable to stay within the range of an approximate maximum of 95 percent to an approximate minimum of 5 percent exceedance levels if not in the context of the full data range).

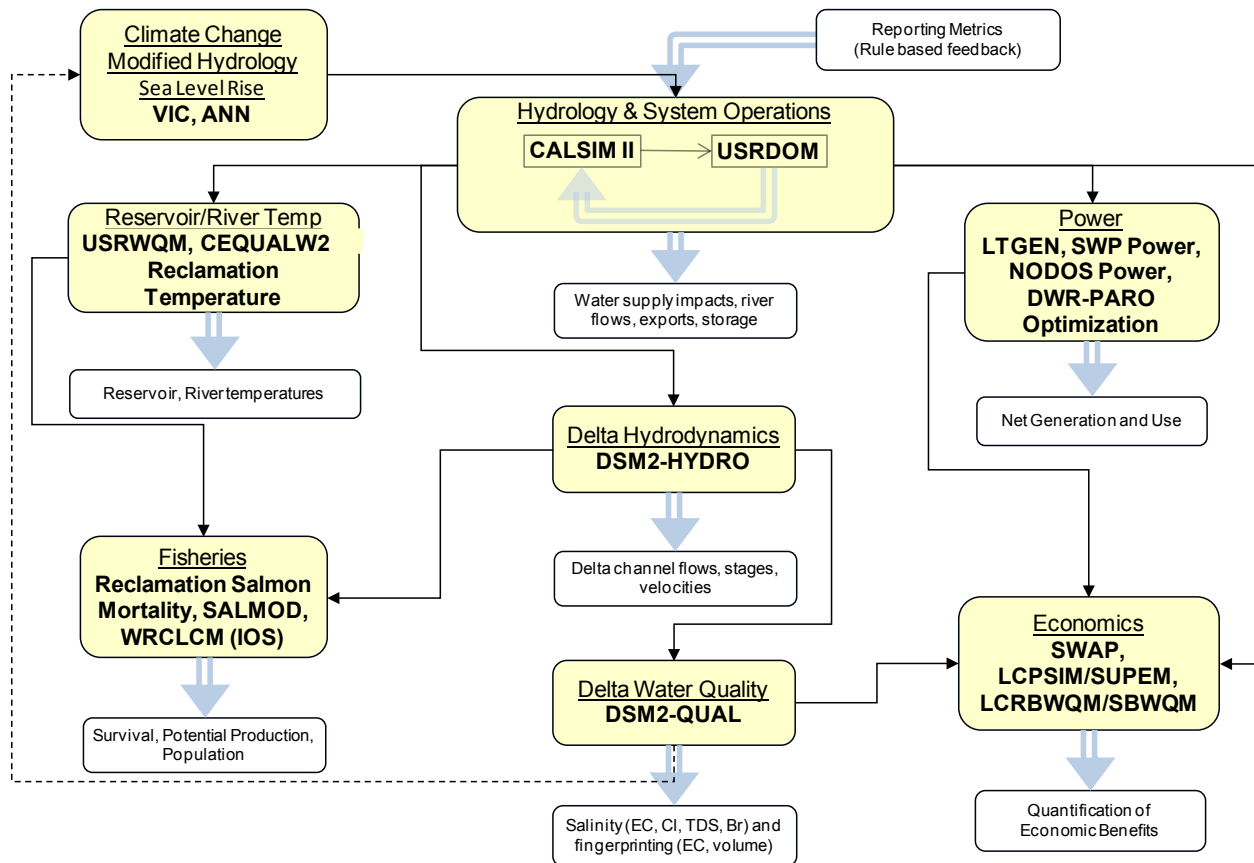

Figure 6B-1 DEIR/EIS Analytical Framework – System (Feasibility, System-Level Impacts)

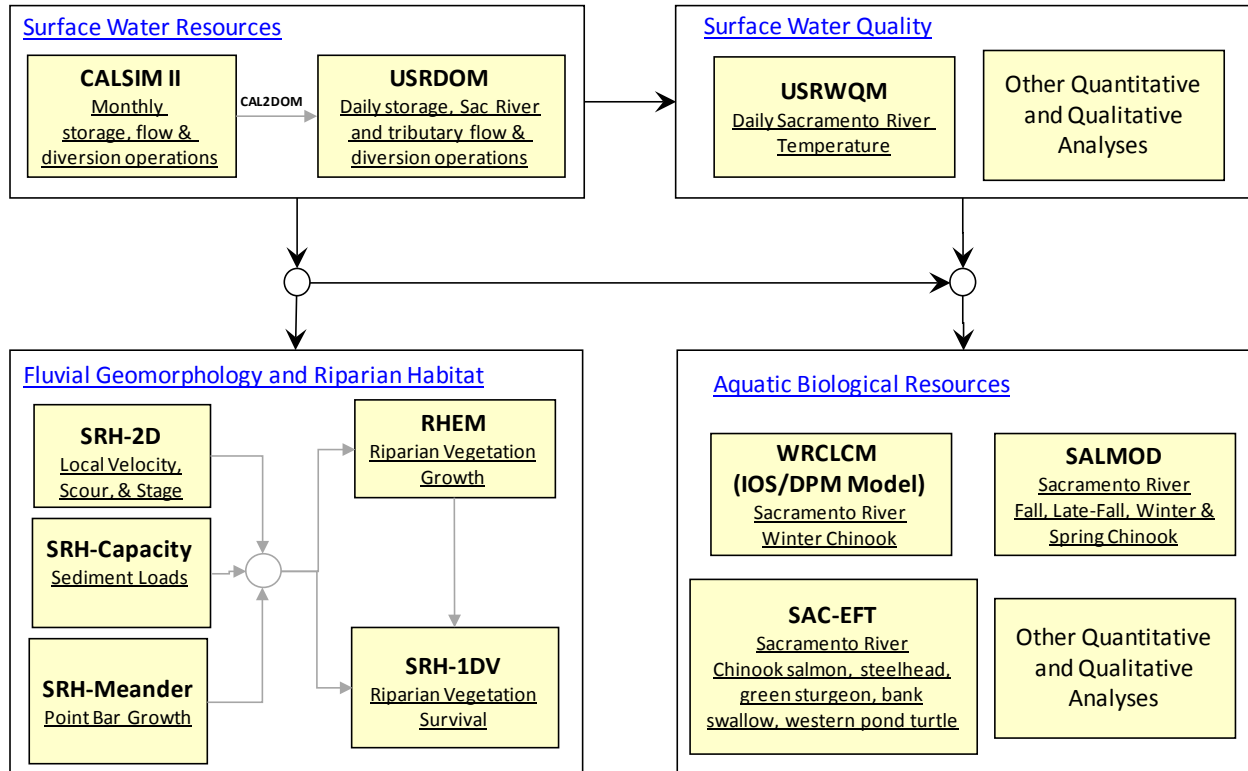

Figure 6B-2 DEIR/EIS Analytical Framework – Local (Local Watershed Impacts)

6B.1.3 State Water Project and Central Valley Project Operations Model (CALSIM II)

As described in the Section 6B.1.2, CALSIM II is the core model in the analytical framework for the impact evaluation of the DEIR/EIS Alternatives. Assumptions used in modeling the alternatives are summarized in Appendix 6A Modeling of Alternatives.

6B.1.3.1 Description

CALSIM II is a generalized reservoir-river basin simulation model that allows for specification and achievement of user-specified allocation targets, or goals (Draper et. al., 2004). The current application to the Central Valley system is called CALSIM II and represents the best available planning model for simulating the SWP and CVP system operations.

CALSIM II covers the valley floor drainage area of the Sacramento and San Joaquin Rivers, the upper Trinity River, and the San Joaquin Valley, Tulare Basin, and southern California areas served by the Federal Central Valley Project (CVP) and the California State Water Project (SWP). The focus of CALSIM II is on the major CVP and SWP facilities, but operations of many other facilities are included to varying degrees.

On a monthly time-step, CALSIM II utilizes optimization techniques to route water through a network of storage nodes and flow arcs based on a series of user-specified relative priorities for water allocation and storage. A linear programming (LP)/mixed integer linear programming (MILP) solver determines an optimal set of decisions for each time period given a set of weights and system constraints. Physical capacities and specific regulatory and contractual requirements are input as linear constraints to the

system operation using the water resources simulation language (WRESL). The model user describes the physical system (dams, reservoirs, channels, pumping plants, etc.), operational rules (flood-control diagrams, minimum flows, delivery requirements, etc.), and priorities for allocating water to different uses in WRESL statements. For each time step, the solver maximizes the objective function to determine a solution that delivers or stores water according to the specified priorities and satisfies all system constraints. The sequence of solved linear programming problems represents the simulation of the system over the period of analysis.

CALSIM II includes an 82-year modified historical hydrology (water years 1922-2003) developed jointly by DWR and USBR. Water diversion requirements (demands), stream accretions and depletions, rim basin inflows, irrigation efficiency, return flows, non-recoverable losses, and groundwater operation are components that make up the hydrology used in CALSIM II. Sacramento Valley and tributary rim basin hydrologies are developed using a process designed to adjust the historical observed sequence of monthly stream flows to represent a sequence of flows at a future level of development. Adjustments to historic water supplies are determined by imposing future level land use on historical meteorological and hydrologic conditions. The resulting hydrology represents the water supply available from Central Valley streams to the system at a future level of development.

An Artificial Neural Network (ANN) has been developed (Sandhu et al. 1999) that attempts to mimic the flow-salinity relationships as simulated in DSM2, but provide a rapid transformation of this information into a form usable by the CALSIM II operations model. The ANN is implemented in CALSIM II to constrain the operations of the upstream reservoirs and the Delta export pumps in order to satisfy particular salinity requirements. A more detailed description of the use of ANNs in the CALSIM II model is provided in Wilbur and Munévar (2001) and more recently in Seneviratne and Wu (2007).

CALSIM II uses rule-based algorithms for determining deliveries to north-of-Delta and south-of-Delta CVP and SWP contractors. This delivery logic uses runoff forecast information, which incorporates uncertainty and standardized rule curves. The rule curves relate storage levels and forecasted water supplies to project delivery capability for the upcoming year. The delivery capability is then translated into SWP and CVP contractor allocations which are satisfied through coordinated reservoir-export operations.

The CALSIM II model is described in detail in Draper et al (2004) and DWR (2002), and has been subject to two peer reviews in the past 8 years (Close et. al 2003 and Lund et. al 2006). More information on the CALSIM model can be found at www.modeling.water.ca.gov.

6B.1.3.2 Objective

The CALSIM II model is the fundamental model upon which all the other models used in the analytical framework rely upon for inputs. The CALSIM II model is used to reconcile all of the constraints associated with CVP and SWP operations throughout the state of California. CALSIM II model allows for an integrated evaluation of the hydrology, fisheries, water quality, and water supply related operational objectives of the system, and specifically of the Sacramento – San Joaquin River Delta estuary. Plans and policies envisioned for this complex water resources system are simulated in CALSIM II. Reconciliation of sometimes conflicting operational rules is the purpose of CALSIM II. Fundamental to the evaluation of the Project is the reconciliation of the various constraints included in the Existing and No Action Alternative Conditions, described in Appendix 6A Modeling of Alternatives.

6B.1.3.3 Assumptions

The detailed modeling assumptions used for the alternatives modeled for the DEIR/EIS are described in Appendix 6A Modeling of Alternatives.

6B.1.3.4 Overview of the Planning Analysis

Typical long-term planning analyses of the Central Valley system and operations of the CVP and SWP have applied the CALSIM II model for analysis of system responses. CALSIM II simulates future SWP/CVP project operations based on an 82-year monthly hydrology derived from the observed 1922-2003 period. Future land use and demands are projected for the appropriate future period. The system configuration consisting of facilities, operations, and regulations are input to the model and define the limits or preferences on operation. The configuration of the Delta, while not simulated directly in CALSIM II, informs the flow-salinity relationships and several flow-related regressions for interior delta conditions (i.e., X2 and OMR) included in the model. For each set of hydrologic, facility, operations, regulations, and delta configuration conditions, the CALSIM II model is simulated. Some refinement of the SWP/CVP operations related to delivery allocations and San Luis target storage levels is generally necessary to have the model reflect suitable north-south reservoir balancing under future conditions.

6B.1.3.5 Analysis of Project Alternatives

CALSIM II was the core model used to simulate the Project operations. In using CALSIM II for simulating Project alternatives, for each DEIR/EIS alternative, description of the physical system for the Project is incorporated in the CALSIM II model. For all the Alternatives, operations were formulated in CALSIM II to simulate the diversion of Sacramento River flow to fill the Project and meet the primary objectives of the project by integrating the operations of the Project with the operations of the existing CVP and SWP reservoirs.

CALSIM II operations used to determine the diversion of the Sacramento River flows to fill the Sites Reservoir were refined based on the daily river flows simulated in the USRDOM. Both the models are simulated iteratively to accurately implement the sub-monthly diversion criteria. This integrated modeling using CALSIM II and USRDOM models is described in detail in Appendix 6C Upper Sacramento River Daily River Flow and Operations Modeling. CALSIM II operations were also refined to achieve the multiple objectives of the Project, based on the feedback from the other models simulating river temperatures, Delta water quality, anadromous fish survival and population, power generation and socioeconomics.

6B.1.3.6 Limitations

CALSIM II is a monthly time-step model. It represents projected conditions under current or future regulatory and operational regimes. The operational decisions in CALSIM II (e.g., determining the flow needed to meet a salinity standard in the Delta) are on a monthly time-step which do not consider operational responses to changes that are on a sub-monthly timescale. Results for an individual parameter are either a monthly average or an end-of-month condition. Some specific concerns regarding CALSIM II model results include the following:

- CALSIM II is intended to be used in a comparative mode. The results from a “With Project” alternative simulation are compared to the results of a “base” simulation, to determine the incremental effects, of a project. The results from a single simulation may not necessarily represent the exact operations for a specific month or year, but should reflect long-term trends. The model should be used

with caution to prescribe seasonal or to guide real-time operations, predict flows or water deliveries for any real-time operations.

- Storage results from CALSIM II reflect end-of-month conditions and not monthly-average conditions. Therefore, any attributes derived from storage results such as littoral area or water surface elevation in the reservoir reflect end-of-month values.
- CALSIM II operates to a monthly approximation of compliance to selected Delta standards. CALSIM II monthly average salinity (ANN-based EC and chloride estimates) and X2 location outputs (ANN-based) are insufficient and inappropriate to verify compliance without use of other diagnostic information internal to the CALSIM II and the ANN models used (note that ANN outputs are lagged by one month). Following are some more details on CALSIM II D1641 compliance limitations:
 - Even though additional standards are identified in SWRCB D-1641, CALSIM II only recognizes five stations for compliance with a salinity standard:
 - Sacramento River at Emmaton
 - San Joaquin River at Jersey Point
 - Old River at Rock Slough
 - Sacramento River at Collinsville
 - Sacramento River at Chipps Island
 - Some standards in SWRCB D-1641 require compliance for a specified number of days in a year (e.g., CCWD 150mg/L Chloride Standard). In such cases CALSIM II does not have any discretion on which days the standards are met, but rather depends on a predetermined schedule, which cannot be altered dynamically.
 - Some of the standards modeled in CALSIM II may not match exactly with the values specified in the SWRCB D-1641. Modeled standards may be more constrained (“ramped”) to make operations more responsive to comply with a standard over the season.
 - Under severe operational conditions, CALSIM II may fail to comply with D1641 and other standards. This situation occurs rarely and is needed to maintain feasibility of the model solution.
- Determination of X2 compliance in CALSIM II is a complex analysis that considers each of “three ways to win” (SWRCB D-1641). CALSIM II X2 computations reflect monthly average conditions (note that X2 outputs are lagged by one month).
- Code specifically added for use in the Project has modified the X2-related outputs from CALSIM II. The model is capable of tracking theoretical X2 positions with and without the operation of Sites Reservoir for Delta EEA and WQ purposes. The new X2_PRV_NDS record represents the modified X2 parameter that should be used for impact analysis. To avoid confusion, the X2_PRV and X2_PRV_KM records have been removed from the CALSIM II DSS output databases (note that the X2_PRV_NDS record outputs are lagged by one month).
- San Luis Storage operations in CALSIM II are simplified compared to real time operations. The results are uncertain and prone to reflect how CALSIM II represents CVP and SWP operations. This is due to the relatively coarse SWP/CVP allocation decisions (e.g., no updates after May) used in the model and uncertainty in the model’s capability to forecast export capabilities.

- The CALSIM II results have not been improved to consider the full hydraulic conditions associated with the weirs along the Sacramento River that spill flood flows into the Sutter bypass. The USRDOM model should be used for evaluating changes to spills at Ord Ferry, Mouton Weir, Tisdale Weir, and Colusa Weir.

6B.2 Results

This section includes the results from the State Water Project and Central Valley Project Operations Model (CALSIM II) used in the detailed evaluation of the alternatives for the DEIR/EIS (see also the attachments to this appendix).

6B.2.1 Introduction

The CALSIM II results included in this appendix are used in:

- Chapter 6 Surface Water Resources,
- Chapter 7 Surface Water Quality
- Chapter 8 Fluvial Geomorphology and Riparian Habitat
- Chapter 9 Flood Control and Management
- Chapter 12 Aquatic Biological Resources
- Chapter 13 Botanical Resources
- Chapter 14 Terrestrial Biological Resources
- Chapter 15 Wetlands and other Waters
- Chapter 21 Recreation Resources

For each parameter and location shown in Table 6B-1, Summary Tables reports are provided. In the Summary Tables reports, for each parameter and location shown below, summary tables of USRDOM results by month are included. The tables include long-term average, and averages by water year type (SWRCB 40-30-30 Index). The tables also include the absolute and relative differences between alternatives.

6B.2.2 Locations and Parameters

The locations and the parameters for the results included in this appendix are tabulated below in Table 6B-1.

Percent Difference												

¹ Based on the 82-year simulation period

² As defined by the Sacramento Valley 40-30-30 Index Water Year Hydrologic Classification (SWRCB D-1641, 1999)

³ Relative difference of the monthly average
